Received 19 January 2014; accepted 20 January 2014

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.046; wR factor = 0.122; data-to-parameter ratio = 12.4.

In the title compound, $\text{C}_{15}\text{H}_{15}\text{NO}_4\text{S}$, the dihedral angle between the aromatic rings is $80.81(1)^\circ$ and the dihedral angle between the planes defined by the $\text{S}-\text{N}-\text{C}=\text{O}$ fragment and the sulfonyl benzene ring is $86.34(1)^\circ$. In the extended structure, dimers related by a crystallographic twofold axis are connected by pairs of both $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds and $\text{C}-\text{H}\cdots\text{O}$ interactions, which generate $R_2^2(8)$ and $R_2^2(14)$ loops, respectively. A weak aromatic $\pi-\pi$ stacking interaction is also observed [centroid-centroid separation = $3.7305(3)$ Å].

***N*-(4-Methoxybenzoyl)-2-methylbenzenesulfonamide**

S. Sreenivasa, B. S. Palakshamurthy, S. Madankumar, N. K. Lokanath and P. A. Suchetan

S1. Introduction

As a part of our continued efforts to study the crystal structures of *N*-(aroyl)-arylsulfonamides (Sreenivasa *et al.*, 2014), we report here the crystal structure of the title compound (I) (Fig 1).

S2. Experimental**S2.1. Synthesis and crystallization**

The title compound (I) was prepared by refluxing a mixture of 4-methoxybenzoic acid, 2-methylbenzenesulfonamide and phosphorous oxychloride (POCl₃) for 2 h on a water bath. The resultant mixture was cooled and poured into ice cold water. The solid obtained was filtered and washed thoroughly with water and then dissolved in sodium bicarbonate solution. The compound was later reprecipitated by acidifying the filtered solution with dilute HCl. The compound obtained was filtered and later dried (Melting point: 447 K).

Colorless prisms of (I) were obtained from a slow evaporation of its aqueous methanolic solution at room temperature.

S2.2. Refinement

The H atom of the NH group was located in a difference map and later refined freely. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.96 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2–1.5 times of the U eq of the parent atom).

S3. Results and discussion

In I, the dihedral angle between the two aromatic rings is 80.81 (1)°. Compared to this, the dihedral angle is 73.9 (1)° in *N*-(benzoyl)-2-methylbenzenesulfonamide (II, Suchetan *et al.*, 2010*a*), 89.4 (1)° and 82.4 (1)° respectively in the two molecules in the asymmetric unit of *N*-(4-chlorobenzoyl)-2-methylbenzenesulfonamide (III, Suchetan *et al.*, 2010*b*), 88.1 (1)° and 83.5 (1)° respectively in the two molecules in the asymmetric unit of *N*-(4-methylbenzoyl)-2-methylbenzenesulfonamide (IV, Gowda *et al.*, 2010) and 83.8 (2)° in *N*-(4-nitrobenzoyl)-2-methylbenzenesulfonamide (V, Suchetan *et al.*, 2011). This shows that introducing a substituent into the para position of the benzoyl ring of II correlates with a increase of the dihedral angle between the aromatic rings. In contrast to this, the dihedral angle is small in *N*-(4-methoxy-benzoyl)-benzenesulfonamide (VI, Sreenivasa *et al.*, 2014) and *N*-(4-methoxybenzoyl)-4-methylbenzenesulfonamide (VII, Sreenivasa *et al.*, 2013), the dihedral angle being respectively 69.81 (1)° and 78.62 (16)° in VI and VII. Further, the molecule is twisted at the S atom, the dihedral angle between the planes defined by the S—N—C=O segment in the central chain and the sulfonyl benzene ring being 86.34 (1)°.

The supramolecular architecture of I is built in three stages. In the first stage, the molecules are linked into dimers by a crystallographic twofold axis through strong N1—H1...O2 hydrogen bonds, thus generating R₂²(8) rings (Figure 2). These dimers in the second stage are linked through an additional C13—H13...O2 interaction (Figure 2) forming R₂²(14) ring

motif. In the third stage, $\pi(\text{methylphenyl}) \cdots \pi(\text{methylphenyl})$ interactions stabilize the structure, $\text{Cg}(\text{methylphenyl}) \cdots \text{Cg}(\text{methylphenyl})$ distance being 3.7305 (3) Å (Figure 3). The geometries and symmetry operations of various interactions are shown in Table 1.

 $w = 1/[\sigma^2(F_o^2) + (0.0923P)^2 + 2.3453P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} < 0.001$
 $\Delta\rho_{\text{max}} = 0.34 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.51 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
